

SUPPLIWISE

SuppliWise

User Manual

Your personalised supplement advisor, with proof you can check.

For members, new and existing

SuppliWise · User Manual · Version 1.0

Wellness guidance, not a diagnosis. Always consult a qualified healthcare professional before starting, stopping or changing any supplement or medication.

SuppliWise — User Manual

Your personalised supplement advisor, with proof you can check.

Stop guessing. Start knowing what your body actually needs.

About this manual

This is the complete guide to SuppliWise. It is written for two people:

You are...	Start here
New to SuppliWise	Part 1 — Getting started
Already using it, want the full feature list	Part 2 — The features
Curious about the blockchain side	Part 3 — The blockchain layer
Responsible for the system	Part 5 — For administrators

A note on what SuppliWise is. SuppliWise analyses a detailed health assessment and produces a personalised supplement plan. It is a **wellness guidance tool, not a doctor**. Every plan it produces carries a medical disclaimer and a recommendation to consult a professional before you change anything you are taking. Please read Part 4 before you rely on any of it.

Table of contents

Part 1 — Getting started 1. What SuppliWise actually does 2. Creating your account 3. Signing in 4. Your first assessment, step by step 5. Reading your results

Part 2 — The features 6. The Dashboard 7. Recommendations 8. Track Intake — the daily habit 9. Insights 10. Assessment History 11. Exporting a PDF report 12. The AI Chat Assistant 13. Support — talking to a human 14. Your profile and account security 15. Plans, pricing and upgrading

Part 3 — The blockchain layer (Web3) 16. What the blockchain layer is for 17. Your wallet and identity 18. Earning WELL 19. Achievements 20. Staking 21. The marketplace, escrow and disputes 22. Your data and your consent 23. Verifiable AI recommendations 24. Community knowledge base and DAO voting 25. Trials, oracles and expert consultations 26. The chain explorer and product verification

Part 4 — Important things to know 27. Privacy: what is and is not recorded 28. Troubleshooting

Part 1 — Getting started

1. What SuppliWise actually does

Most supplement advice is generic. SuppliWise is different in five concrete ways:

1.1 It reads your whole picture, not a checkbox

You fill in a four-step assessment covering your age, diet, goals, medical conditions, symptoms and their severity, sleep, water, habits, medications, allergies and blood tests. The plan is generated from *that* — including the things you did not tick. Leave a field empty and you get a more generic answer; fill it in and the plan gets sharper.

1.2 Every recommendation explains itself

Each card tells you:

- **"Recommended for:"** — the exact conditions, symptoms or goals that triggered it
- A **condition callout**, e.g. *"Since you reported Diabetes with moderate fatigue..."*
- Dosage, timing, interaction warnings
- **Expand the card** → the peer-reviewed evidence, with journal names and study IDs
- **Tap for Details** → a personalised deep-dive written for *your* profile

1.3 It works even if the AI is down

If the AI provider is unreachable, a built-in clinical rules engine takes over. You always get a plan. You will simply get a less nuanced one.

1.4 It tracks whether you actually did it

A recommendation is worth nothing if you do not take it. SuppliWise tracks daily intake, computes adherence, builds streaks and gives you a Wellness Score out of 100.

1.5 Every recommendation can be independently checked

You can anchor what the AI was given and what it produced to a tamper-evident log, then later re-verify it. If the recommendation was quietly edited after the fact, verification fails and you can see it. This is explained in [Part 3](#).

2. Creating your account

1. Open the site and click **Sign In** → **Create one**.
2. Fill in first name, last name, date of birth, gender, email and a password.
3. Solve the **maths CAPTCHA** — a small arithmetic question, used to stop automated sign-ups.
4. Click **Register**.

Choosing a password

One policy applies everywhere in SuppliWise:

Rule	Requirement
Length	10 to 128 characters
Uppercase	at least one A–Z
Lowercase	at least one a–z
Digit	at least one 0–9
Symbol	at least one, e.g. ! @ # \$ %

The form shows a live checklist and a 0–4 strength bar, and it refuses common passwords, sequences like **password123**, and anything built from your own email address. Both rules and the checklist come from the same server, so the form can never disagree with what is actually enforced.

Tip: a long passphrase ("correct-horse-battery-staple") beats a short complicated one.

3. Signing in

1. Enter your email and password, then click **Sign In**.
2. If you have set up a second factor, a **Login Verification** step appears — see [Two-Factor Authentication](#).

"Save my login on this browser"

Tick this on a **personal device** to stay signed in for 30 days. The saved credential is listed under **Account Security** → **Signed-in Devices** with a **Saved login** chip, and you can revoke it at any time. Never tick it on a shared or public computer.

Signing in with a passkey

If you have registered a passkey (fingerprint, Face ID, screen lock), the button **Sign in with a passkey** appears under the password form. This is the strongest and fastest sign-in method available, and it cannot be phished.

Using several accounts at once

SuppliWise supports **multiple accounts across browser tabs**. Sign into account A in one tab and account B in another and both stay live. Switch between them under **Profile** → **Accounts**, or open the account menu in the top-right corner.

Only **one session per account** is active. Signing in again on a new device or browser signs out the previous session *for that same account only* — your other accounts are untouched.

If you are locked out

Repeated failed attempts escalate: **15 minutes** → **1 hour** → **6 hours** → **24 hours**. Offences decay after 30 days. If you cannot get in, use **Forgot your password?** — it sends a link that works once and expires in 30 minutes.

4. Your first assessment, step by step

Go to **Dashboard** → **New Assessment**. The form is **Step 1 of 4**. Your progress is saved in the browser, so you can navigate away and come back.

Assessments are closed between midnight and 4:00 AM

"Today's Supplements" resets at **4:00 AM in your own timezone**, and the assessment form is closed during the four hours before that reset. If you open it in that window you will see a "Reopens at ..." message. **Your answers are saved** — come back after 4 AM.

Step 1 — Basic Information

Field	Notes
Age	Required. If you are signed in this is calculated from your date of birth and shown read-only.
Gender	Required. Drives which questions you are asked.
Weight	Required. Toggle between kg and lbs .
Height	Required. Toggle between cm and ft / in .
Physical Activity Level	Sedentary , Light (1–3 days/week) , Moderate (3–5 days/week) , Very Active (6–7 days/week) . Children under 13 skip this.

Step 2 — Diet & Health Goals

Diet Type — nine options, each with a **?** tooltip explaining it:

Omnivore · **Vegan** · **Keto** · **Paleo** · **Mediterranean** · **Carnivore** · **DASH** · **Flexitarian** · **Pescatarian**

Health Goals — pick as many as apply, grouped into:

- **General:** Increase Energy, Improve Sleep, Boost Immunity, Support Heart Health, Digestive Health
- **Fitness / Physical:** Muscle Gain, Fat Loss, Improve Strength, Improve Endurance
- **Fitness / Mental:** Mental Focus, Stress Reduction
- **Wellness:** Skin & Hair Health, Bone & Joint Health, Eye & Vision Health, Brain & Mental Health

Children under 13 see a reduced, age-appropriate goal list.

Step 3 — Medical Information and Current Symptoms

Medical Conditions — tick all that apply, or tick **None**:

- *Cardiovascular & Metabolic:* Hypertension (High Blood Pressure), High Cholesterol, Diabetes, Heart / Cardiovascular Disease, Obesity
- *Bone & Joint:* Arthritis, Osteoporosis, Gout
- *Digestive:* IBS (Irritable Bowel Syndrome), Celiac / Gluten Sensitivity
- *Respiratory & Immune:* Asthma, Autoimmune Disorders
- *Mental Health:* Anxiety Disorder, Depression
- *Other:* Thyroid Disorders, Anemia, Chronic Kidney Disease, Liver Disease, Migraine, and PCOS (female only)

Current Symptoms — how this works:

1. Tick **None** if you have no conditions → you get a general list of 15 symptoms.

2. Tick one or more conditions → you get, for each condition, a focused list of the symptoms relevant to it, plus a "No symptoms for {condition}" option.

Every symptom you tick needs a severity: **Mild** , **Moderate** or **Severe** . Each option carries a short description so you can judge. If you skip a severity you cannot continue.

Severity is not decoration. Severe cases are flagged for **Priority review**, and the AI is told to be more careful. Be honest.

Step 4 — Lifestyle and Health Background

Lifestyle

Field	Options
Sleep Quality	Very Poor (<4 hrs) , Poor (4–5 hrs) , Average (6–7 hrs) , Good (7–8 hrs) , Excellent (8+ hrs)
Daily Water Intake	Less than 4 glasses , 4–6 , 7–8 , 9 or more
Lifestyle Habits	Smoking , Alcohol , Recreational Drugs , None
Daily Sun Exposure	None , <15 min , 15–30 min , 30–60 min , 1 hr+
Daily Protein Intake	Very Low (<50g) , Low (50–80g) , Moderate (80–120g) , High (120g+) , Not sure

If you tick **Recreational Drugs**, a text box appears asking which ones. This is asked because some interact dangerously with prescribed medication. Your answer is treated confidentially and triggers a **Seeking Support** section in your results with four Philippine helplines: **DOH SAH 1550, DDB, DSWD Yakap Bayan, NCMH 1553.**

Health Background

Question	What to enter
Currently Taking Supplements?	Yes/No. If yes, list them. Pre-filled from your current plan.
Recent Blood Test?	Yes/No. If yes, paste the findings, e.g. "Low vitamin D (18 ng/mL), low ferritin (12), normal B12".
Current Medications	List them, or tick None .
Known Allergies	List them, or tick None .

Female-Specific Questions (shown when gender is Female)

- **Pregnant?** Yes / No
- **Breastfeeding?** Yes / No

Both change the plan substantially — certain supplements are excluded or dosed differently.

All Step 4 fields are optional, but **the more you fill in, the more specific your plan**. Everything you type is checked for spam and garbage text; junk is stripped and you are told which fields looked unreadable.

Getting your results

Click **Get Recommendations** →. An AI progress screen runs for about 10–20 seconds, then your plan appears. See [Reading your results](#).

5. Reading your results

Your results page has a **Simplified / Detailed** toggle in the corner. Try both — Detailed shows the evidence and citations.

Section	What you get
 Supplement Recommendations	Up to 20 supplements, sorted High → Medium → Low priority, then by confidence score.
 Your Daily Schedule & Recovery Plan	When to take what, grouped by time of day.
 Lifestyle Recommendations	Habits worth changing.
 Meal Recommendations	Diet-aware, allergy-safe, condition-specific meal ideas.
Seeking Support	Only if you reported recreational drug use.
Banners	"Wellness guidance, not a diagnosis" and "Medical Consultation Recommended".

The two buttons on each supplement card

Button	What it does
Add to Plan	Adds the supplement to your daily plan. Click again to remove it.
Tap for Details	The AI writes a personalised long-form guide for <i>your</i> profile. Cached for 30 days, so re-reading costs nothing.

Reading the confidence score

Each card shows an animated confidence bar. It means **how strongly your profile supports this supplement** — not how strong the science is. A low score with a high priority means "this is important, but your answers did not strongly point at it; treat it cautiously."

Supplements already in your plan

Anything already on your plan automatically sorts to the **bottom** of the list, so you can see what is genuinely new at a glance.

Part 2 — The features

6. The Dashboard

Your signed-in home page. Four action cards get you anywhere:

Card	Goes to
New Assessment	/assessment
Recommendations	/recommendations
Track Intake	/track-intake
Insights	/insights

Plus three live panels:

- **Today's Supplements** — your doses for the current plan day, tickable straight from the dashboard, with a taken count.
- **Wellness Score** — a gauge out of 100. Hover (or tap) "**How Wellness Score Works**" for the exact arithmetic.
- **Quick Stats** — Streak, Adherence rate, Today's Progress, Energy level.

How your Wellness Score is calculated

Component	Range	What it measures
AI baseline	0 – 30	How healthy your assessment says you are
Adherence bonus	0 – 50	How consistently you take your plan
Streak bonus	0 – 20	How long you have kept it up
Total	0 – 100	

Missed doses reduce it. A dose taken *late* is **not** counted as missed — SuppliWise knows the difference between "morning dose at 7 AM" and "morning dose at 2 PM".

The 4 AM reset — the single most important thing to understand

A "plan day" runs from 4:00 AM to 4:00 AM in your own timezone.

This is deliberate. Almost nobody takes a supplement at 3 AM. If the day rolled over at midnight you would be shown yesterday's unticked doses at 1 AM and your streak would evaluate against a day you cannot see. So:

Time (your timezone)	What you see
04:00 – 23:59	Today's plan day
00:00 – 03:59	Yesterday's plan day — still the day that is running

Your timezone is read from your device. You never set it by hand, and SuppliWise cannot be fooled into changing it by a header.

Streaks

Rule	Detail
Earning	Finish 100% of your doses and you get +1
Undoing	Un-ticking before midnight reduces the streak
Midnight reset	An incomplete day resets the streak to 0
One per day	A day can only ever add +1
Adding mid-day	Adding a supplement after you have already completed the day breaks completion — it is a fresh obligation

7. Recommendations

Where: Recommendations in the dashboard, or the top-right area nav.

- Filter tabs: **All Recommendations**, **High priority**, **Medium priority**, **Low priority**
- Search box
- **Simplified / Detailed** toggle
- Per card: **Add to my plan / In your plan**, and **Track today**
- ✓ **Backed by research** /  **Evidence & References** expands to the citations
- A consult-a-doctor banner sits above the list

Three empty states, so the page is never blank without explanation: **No recommendations yet**, **Your assessment is still being analysed**, **Nothing matches that search**.

8. Track Intake — the daily habit

Where: Track Intake in the dashboard.

- **Today's Supplements** — grouped into time slots (Morning, Afternoon, Evening, Night), each with a High / Medium / Low priority legend
- Tick a dose to mark it taken; tick again to undo
- **Missed doses** tray at the bottom
- **Overall Adherence** percentage
- **Calendar** — a visual month view of your completion history

Empty state offers **Take Assessment** or **Go to AI Recommendations** so a new account is never staring at a blank tracker.

9. Insights

Where: Insights in the dashboard. *Requires Deluxe or above.*

Four tabs:

Tab	Contents
Overview	At a Glance, Your Current Phase, Lifestyle Recommendations
Today's Progress	Today's completion with the current plan-day label
Adherence	A weekly bar chart plus your wellness journey phases
AI Insight	Personalised guidance for your phase

On a lower plan the page shows a **PlanLockedCard** explaining what the upgrade buys, rather than a dead screen.

10. Assessment History

Where: the History icon in the top navigation bar.

Four summary tiles: **Assessments**, **Active record**, **With AI analysis**, **Flagged priority**, plus **Until next expiry**.

Each record can be:

- **Viewed** — all four steps of what you originally answered, including symptom choices and severities
- **Opened as results** — the full AI plan, in six tabs:  **Assessment** ·  **Supplements** ·  **Schedule & Recovery** ·  **Meals** ·  **Lifestyle** ·  **Warnings** (plus **Seeking Support** when applicable)
- **Downloaded as PDF**
- **Deleted** — permanently

There is a search box and a status filter, and a **Start new** button.

How much history you can page through depends on your plan:

Plan	Records per page
Free	5
Deluxe	10
Premium	20
Ultimate	20

Below Premium the older pages show **More history is locked**.

Your records are kept for five years. If your days run out and you drop back to Free, **nothing is deleted** — you simply lose access to the newer features.

11. Exporting a PDF report

Where: Export PDF on the results page, on a history record, or in the admin console. *Requires Deluxe or above.*

The report is a formatted A4 document. Its cover states **who it was prepared for** and **the date and time of generation**. It contains:

1. Clinical summary
2. Consult-a-doctor alert
3. Patient profile
4. Recommendations with dosage and timing
5. Evidence and RRL citations
6. Daily schedule
7. Lifestyle advice
8. Meal recommendations
9. Your 5-phase action plan
10. Warnings and things to avoid
11. Seeking Support resources, if applicable

There is also a dedicated **Security Report** export in the admin Security Center.

On a phone: the Android app writes generated PDFs into your device's normal Downloads location, so they open in any PDF reader.

12. The AI Chat Assistant

Where: the floating **Ask AI** bubble on any member page. *Requires Ultimate.*

- Multi-turn conversation with history
- Quick prompt buttons to get you started
- **Typo tolerance** — misspell a supplement or condition and it gently corrects you
- **Scoped to health, nutrition and SuppliWise** — politely declines off-topic questions, and the guardrail is on the server, not just hidden in the interface
- Works offline with a canned local reply if the AI is unreachable

It is deliberately hidden on sign-in pages, `/support` and the whole admin area.

Chat is not Support. See the next section — they are different products.

13. Support — talking to a human

Where: Support in the top navigation, or **Support** in the account menu.

This is a **real, stored conversation with a person** — not the AI. It requires a signed-in account, because an administrator needs to know who to reply to.

- Open a thread with a category: **Payment, Billing & plans, My account, Technical, Something else**
- Reply and see the administrator's answer in the same transcript
- An unread badge, jump-to-latest, and auto-follow only when you are already at the bottom
- Filters: **All, With support, Your turn, Resolved**
- Once a thread is **resolved** it becomes read-only. An administrator can reopen it.

	AI Chat Assistant	Support
Who answers	Software	A person
Stored?	No	Yes, permanently
Available on	Ultimate	Every plan
Good for	"Is magnesium safe with my medication?"	"My payment was taken but nothing happened"

14. Your profile and account security

Where: click your avatar → **Personal Info / Edit Profile / Account Security / Accounts / Plan & billing**.

Personal Information

- Profile picture — drag and drop, or click to browse
- Profile banner — customisable
- First name, last name, date of birth
- Changing your **email or date of birth requires an OTP code** emailed to you, with a countdown before you can resend

Account Security

Security lives in its own panels, deliberately kept away from "Edit your name".

Panel	What it does
Passkeys	Register, rename and remove fingerprint / Face ID / screen-lock keys
Two-Factor Authentication	Authenticator app or email codes, with a strength indicator
Change Password	Current + new password against the shared policy, with a live checklist
Recovery Codes	Ten single-use codes. Viewed once . Can be regenerated or invalidated
Recovery Email	A second address, OTP-verified, for when you lose your phone
Signed-in Devices	Every device with its label, platform, location, IP and sign-in method
Login & Security Activity	A newest-first feed of your own security events

Plus a **Step-up dialog** — the "Confirm it's you" prompt, asking for your password **and** your current authenticator code, before any security change is allowed.

Two-Factor Authentication

Method	Strength	Notes
Authenticator app	Strongest	6-digit code that changes every 30 seconds (Google Authenticator or any TOTP app)
Email codes	Weaker	6-digit code sent to your account email

- Turning 2FA **on** or **off** requires step-up verification
- Turning it off deletes the authenticator secret **and** destroys all recovery codes
- Removing your last strong method is **refused** — you cannot lock yourself out
- If 2FA is on but the secret is unreadable, SuppliWise **falls back to email codes** rather than locking you out permanently

Set up a recovery email and save your recovery codes somewhere offline. Losing your phone with no recovery method is the single most common way people get locked out.

Managing devices

Under **Signed-in Devices** you can **Sign out** any single device, or **Sign out all other devices**. Devices marked **This device** is you right now; **Saved login** means the 30-day "save my login" credential.

Accounts

Add another account, switch between them, or sign any of them out — independently.

15. Plans, pricing and upgrading

Where: **Plans** in the top navigation. The page is **public** — you do not need an account to compare plans.

Plan	Unlocks
Free	Health Assessment, Supplement Recommendations, Daily Intake
Deluxe	+ Insights & Analytics, PDF Report Export, the entire blockchain layer
Premium	+ Priority Assessment, 5-Year Record History
Ultimate	+ AI Chat Assistant — everything SuppliWise has

There are exactly four plans.

How billing actually works

- A purchase is exactly **30 days**. **Nothing renews automatically.**
- Buying again **extends** your window rather than restarting it — no paid day is ever lost.
- Changing plan applies **immediately**, with no sign-out.
- When your days run out you return to Free. **Your assessments and history are kept.**
- There are no automatic charges and no refunds. Every "refund" you will see in the marketplace is Web3 escrow, which is a different thing entirely.

How to upgrade

1. Open **Plans**, pick your plan and your currency.
2. You are shown the amount, computed **on the server**.
3. Submit the request with a **payment reference** and, optionally, a photo of your proof of payment.
4. An **administrator reviews** it and approves (optionally adjusting the number of days granted) or declines with a note.
5. Your new plan is live immediately. You do not sign out.

Cancelling runs through the same review process in the opposite direction.

Currency

Base prices are held in **PHP on the server** and every other currency is derived there, so a displayed price can never disagree with the charged price. Detection order: your saved preference → a `?currency=` link → your browser language → your location → PHP. The picker always tells you where the number came from.

What you see when a feature is locked

Locked features render a **PlanLockedCard**, not a dead end. It tells you:

- 1. What the feature is **worth** first
- 2. The literal gap — "you are on Free, this needs Deluxe"
- 3. Exactly what the upgrade buys

Part 3 — The blockchain layer (Web3)

Everything in this part requires Deluxe or above.

16. What the blockchain layer is for

You do not need to understand blockchain

SuppliWise runs a **self-contained proof-of-work log inside the app**. There is no external network, no gas fees, no crypto wallet to fund, and nothing to install. Your account simply gets a wallet the first time you open the Web3 area, with **100 WELL** already in it.

WELL is a points token. You cannot buy it with real money and you cannot cash it out. It is used for marketplace trading, staking, loyalty discounts and expert bookings.

What it actually gives you

Goal	Which feature
"Is this bottle genuine?"	Product verification
"Prove a recommendation has not been quietly edited"	Verifiable AI
"Hand my doctor my history without an account"	Shareable profile
"Sell supplements safely, buyer-protected"	Marketplace & escrow
"Have a say in how the platform's economics work"	DAO voting
"Earn something for staying consistent"	WELL rewards

The one rule that matters

Your personal health data is never written on the blockchain. Only a SHA-256 fingerprint is. Your records stay in the application's own database.

See [Privacy](#) for the detail.

Where things are

Screen	Route	Contains
Web3 Hub	<code>/web3</code>	8 tabs: Wallet & Identity, Rewards & NFTs, Health Ledger, Privacy & Data, AI Proof, Trials & Oracles, Supply Chain, Block Explorer
Marketplace	<code>/marketplace</code>	Browse, My Orders, Sell, Disputes
DAO Governance	<code>/governance</code>	Proposals, New Proposal, Knowledge Base
Verify a product	<code>/verify</code>	Public — no account needed

Administrators cannot use any of it. They have no health profile and no wallet, and the server rejects them.

17. Your wallet and identity

Where: Web3 Hub → **Wallet & Identity**.

The first time you open it, SuppliWise creates your wallet automatically and credits your **100 WELL welcome bonus**. You will see:

- **DID** — `did:suppliwise:...`, your decentralised identifier
- **Address** — `0x...`, your public account on the SuppliWise chain
- **WELL balance** and, if you stake, your **staked** amount
- **ed25519 public key** — used to sign your health credentials

Exporting your private key

Export private key gives you a standard **PKCS#8 PEM** file (`-----BEGIN PRIVATE KEY----- ...`).

 **Anyone holding this key controls your wallet.** Store it offline — a password manager, a hardware wallet, a printed copy in a safe. Never paste it into a website, a chat, or a screenshot. SuppliWise stores it encrypted and only decrypts it for you, but the export is final.

18. Earning WELL

Where: Web3 Hub → **Rewards & NFTs.**

Action	Reward	Rule
Daily check-in	5 WELL + 1 per consecutive day, capped at +10	One tap per day. A second tap returns " <i>already claimed</i> " and mints nothing
Intake reward	5 WELL	Only unlocks once you have actually logged a dose today
Assessment reward	15 WELL	Once per assessment
Data-sharing reward	25 WELL	See Your data and your consent
Health-ledger anchor	3 WELL	Once per day
Publish a knowledge post	10 WELL	See Knowledge base
Receive an upvote	2 WELL each, capped at 40 total	
Upvote someone's post	1 WELL	The curator reward

The intake and assessment buttons stay **locked** until the server confirms the real activity happened — you cannot farm them by clicking.

Viewing your reward history

History lists every reward with the exact block and transaction that recorded it, each row linking to the chain explorer.

Why you cannot double-dip: the database enforces one reward per (*user, activity, reference*). A second attempt is rejected at the database level, not merely hidden in the interface.

19. Achievements

Where: Web3 Hub → **Rewards & NFTs** → **Achievements.**

Eleven milestones, detected from your **real** activity: first assessment, 7-day streak, data pioneer, governor, market participant, trailblazer, verified professional, and more.

Press **Check achievements** and anything you now qualify for is minted with a token ID, an edition number and an on-chain mint record.

Achievements are **soulbound** — earned once, never re-minted. Pressing the button again simply mints nothing.

20. Staking

Where: Web3 Hub → **Rewards & NFTs** → **Staking**.

Action	Effect
Stake	Moves WELL from your spendable balance into your staked balance
Unstake	Returns it — any amount, any time
Yield	12% APY , credited automatically the next time your wallet is used, pro-rated for elapsed time

Reaching the governance threshold (**500 WELL staked**) unlocks premium perks; a progress bar shows how close you are.

Staked WELL also increases your **DAO voting weight**.

21. The marketplace, escrow and disputes

Where: Marketplace.

Selling

Create a listing — title, brand, category, price in WELL, stock. Your listing is anchored on-chain. The first six demo products are sold by the official SuppliWise brand wallet, so you can try buying before you ever sell.

Buying, with escrow protection

The 3% fee is shown on the order before you commit. **The seller is not paid until you confirm delivery.**

If something is wrong

1. Open the order → **Open dispute** and describe the problem (at least 10 characters).
2. Independent **jurors** — WELL holders who staked, and who are **not** part of the order — are appointed and vote.
3. Outcome:

Verdict	Result
Buyer wins	Full refund, stock returned
Seller wins	Escrow released to the seller
Tie	Nobody is paid until there is a clear verdict

Jurors are paid for their service, and their votes are weighted by their stake.

You can never vote on your own dispute, and both buyer and seller are excluded from the jury. That is enforced on the server, not just hidden in the interface.

Loyalty codes

Rewards → **Loyalty** — redeem 10+ WELL for a one-time **LOY-...** code. Apply it at checkout to reduce the order total. Codes are **single use**; a used code is rejected.

22. Your data and your consent

Where: Web3 Hub → **Privacy & Data** and **Health Ledger**.

Your health ledger

A rolling **digest** — a SHA-256 fingerprint — of your assessments and intake history, plus snapshots anchored to the chain.

The chain stores the **digest and counts**. It never stores your health data.

Verifiable export

Export a **signed health credential** to hand to a doctor or nutritionist. It carries a digital signature, so the recipient can confirm it came from you and was not altered.

Share your profile — public link, no account needed

Generate a **time-boxed link** (1 hour to 30 days) that opens a read-only clinician view of your summary. **Your doctor does not need a SuppliWise account.**

You can revoke a link at any moment and it stops working **immediately**. The view carries a disclaimer that it is not a diagnosis, and shows an integrity anchor.

Share anonymised data for research — earn 25 WELL

Name a research institution and pick a scope. SuppliWise then builds the dataset **on the server**:

- **Coarse bands only** — age band, gender, volume bands
- **Never** your name, exact dates, identifiers or free text
- Encrypted at rest and stored under a content address
- Your **consent is anchored** on-chain

You can revoke at any time. Revoking anchors the revocation *and destroys the stored dataset*, so it can no longer be retrieved — not merely hidden.

Encrypted storage

Store any JSON payload — notes, records, exports — encrypted with AES-256-GCM under a `bafy...` content ID. Fetching it re-checks the content ID, so tampering is detectable.

Revoking a data share destroys only that dataset. Your other stored items are untouched.

23. Verifiable AI recommendations

Where: Web3 Hub → **AI Proof**, or the results of an assessment.

This is the feature that answers "*did they change my recommendation without telling me?*"

How to use it

1. After an assessment, **anchor** it. SuppliWise hashes **three things separately**: what the AI was *given*, what it *produced*, and which *logic version* produced it.
2. That combined hash is anchored on-chain.
3. Later, **re-verify**. SuppliWise recomputes all three from the stored record.

If the inputs or outputs were altered after anchoring, verification fails and you can see it. If nothing changed, it passes.

24. Community knowledge base and DAO voting

Where: Governance.

Knowledge Base

Publish a 📄 **Product review**, 📊 **Research finding** or 💬 **Success story** and earn WELL immediately. Other members can upvote: they earn a small curator reward, you earn more up to a cap.

You cannot upvote your own post, and nobody can upvote twice.

Governance

Any proposal can change the platform's economic parameters — the daily check-in reward, the marketplace fee, the staking APY, the quorum, and more.

1. **Create a proposal** — title, description, and optionally which parameter to change. Your own proposal vote is cast automatically with your weight.

2. **Vote** for or against other proposals. **One vote per wallet**, weighted by `balance + staked` at the moment you vote.
 3. A proposal **passes** when total voting weight reaches the **quorum** and FOR strictly outweighs AGAINST. **Ties fail**.
 4. When the voting period ends the outcome is finalised automatically, and a passed proposal **actually changes the platform's settings** — with the execution recorded on-chain.
-

25. Trials, oracles and expert consultations

Where: Web3 Hub → **Trials & Oracles**.

Clinical trials

Browse open studies. Opting in hashes the **exact terms** — sponsor, data scope, revocability, reward — and anchors them on-chain, then pays the participation reward.

You can withdraw at any time, and the withdrawal is anchored too. One consent per trial.

Oracle feeds

Live reference feeds for supplement prices, a WELL index and research signals. Each is re-derived daily and anchored whenever a value changes. The same values appear next to marketplace listings, so you can sanity-check a seller's price.

Expert consultations

Four verified professionals: clinical nutrition, functional medicine, sports nutrition and micronutrient research.

Booking pays `rate × hours` in WELL into the professional's pool, recorded on-chain. **Cancel for a full refund.**

26. The chain explorer and product verification

Product verification — public, no account

Where: `/verify`, or the QR code on the bottle.

1. Scan the **QR code**, or type the printed `SW-XXXXXXX` code into the box.
2. You get a verdict:

Verdict	Meaning
✅ AUTHENTIC & VERIFIED	The journey is anchored and every proof re-checked
⚠️ PROOF INCOMPLETE	Partially anchored — treat with caution
⚠️ NOT VERIFIED	Unknown code, or a proof could not be confirmed. Do not trust the product.

3. The page shows the **full journey** — raw material → manufacturing → lab testing → quality release → distribution → retail → delivered — with each step's location, who recorded it and its block number, plus every **certification** (lab report, organic, non-GMO, GMP) with the digest of the result document.

Everything on this page is **recomputed from the chain when you open it**. It is evidence, not marketing copy.

The chain explorer

Where: Web3 Hub → **Block Explorer**.

Every action in Part 3 — reward, transfer, consent, certification, vote, order settlement — is anchored as a transaction in a proof-of-work chain. The explorer shows recent blocks, the chain tip, the current difficulty, and lets you look up any transaction by hash.

Verify chain recomputes every block hash from scratch and reports whether the history is intact.

Part 4 — Important things to know

27. Privacy: what is and is not recorded

This section is the most important one in the manual.

What is **NEVER** written to the blockchain

- Your name, email or profile picture
- Your health conditions, symptoms, medications or allergies
- Your assessment answers, in whole or in part
- Your date of birth or exact dates
- Anything you typed in a free-text box

What IS written

Written on-chain	In the form of
Your health ledger	A SHA-256 digest plus counts
A research dataset you consent to share	A coarse, anonymised, revocable record — age band, gender, volume bands
A recommendation	Three hashes: inputs, outputs, logic version
A consent decision	A hash of the terms
A certification	The result document's digest

The database holds your actual records. The chain holds **proof that those records have not changed**.

What you control

Control	Where
Revoke a shared profile link	Privacy & Data
Revoke research consent — and destroy the dataset	Privacy & Data
Sign out a device	Account Security → Signed-in Devices
Sign out everywhere else	Account Security
Delete an assessment	History
Disable 2FA and destroy recovery codes	Account Security

Who can see what

Surface	Who can access
Product verification page	Anyone , no account
Shared health profile link	Anyone with the link, no account, time-boxed
Your dashboard, history, wallet	You only
Support threads	You and the administrators
Admin console	Administrators only , behind a mandatory authenticator step

28. Troubleshooting

Symptom	What it means and what to do
"Assessments are closed between midnight and 4 AM"	Working as designed. Your plan day resets at 4 AM <i>your</i> time. Answers are saved — return after 4 AM.
Yesterday's doses still showing in the morning	You are between midnight and 4 AM. That day is still running.
A locked feature says "DELUXE plan"	Genuinely a plan gate. Open Plans to upgrade; it applies instantly, no sign-out.
"Your assessment is still being analysed"	The AI call is in flight. It normally takes 10–20 seconds.
Recommendations failed / generic answers	Every AI provider is unreachable, so the rule-based clinical engine ran instead. Results are still valid but less specific.
Chat says it is unavailable	Either you are not on Ultimate, or the AI is down and there is no fallback reply for your question.
Locked out after failed sign-ins	The escalating logout: 15 min → 1 h → 6 h → 24 h. Wait it out, or use Forgot your password?
No email OTP arrives	Check spam. Codes expire after 10 minutes and resending has a 30-second cooldown. Email codes are the <i>weaker</i> method — switch to an authenticator app.
Lost my phone with 2FA on	Use a recovery code , or the recovery email . If you set up neither, this is why the setup screen insists on it.
Passkey not offered	Your browser or device does not support WebAuthn. Use your password.
PDF button missing	PDF export requires Deluxe.
"Load older assessments" locked	Deep history requires Premium.
Marketplace / Web3 / DAO shows an upgrade card	The blockchain layer requires Deluxe.
A reward button says "already claimed"	Working as designed — one claim per activity per day.
A WELL reward button is greyed out	The server has not confirmed the real activity. Log a dose, or complete an assessment, first.
A dispute did not resolve instantly	Verdicts need the appointed jurors to vote. Ties deliberately pay nobody.
Verify chain reports a problem	Contact support via /support . Quote the block number it names.
Page is blank after a deployment	The app self-heals a stale cached bundle automatically. If it persists, hard-refresh.
Something else is wrong	Use Support . It is a real person, and it is stored.

Part 5 — Reference

29. For administrators

Administrators use a **separate console** at `/admin` , guarded by an alias + password **and a mandatory authenticator challenge**. It is a different product surface from the member app and is never reachable from member navigation.

Signing in

- 1. Go to `/admin/login` .
- 2. Enter your alias and password.
- 3. Enter your 6-digit authenticator code.

If your password is a temporary one you are forced to set a new one before anything else opens. The console signs itself out after **10 minutes of inactivity**, with a live countdown driven by the same server value.

The eight console tabs

Tab	What it gives you
Overview	Users, assessments, active/inactive, a 14-day activity chart, plan mix, 2FA adoption, signups, recent signups, threats
User management	Search, filter, expand a user, ban/unban, clear a lockout, delete permanently, edit their subscription inline
Admin management	The admin roster, enable/disable, clear lockouts
Subscription management	Approve or decline plan requests and cancellations, with proof-of-payment images and overridable day grants
Chat management	The support inbox — two panes, status filters, keyboard triage
Assessment Management	Per-member assessment lists, read-only view, AI results, PDF export, modify or delete
AI management	Which AI providers are actually reachable, and which are merely configured
Security	The live 45-probe monitor, the static audit record, and the security report export

Approving a subscription

- 1. Subscription management.

2. Find the pending request; check the payment reference and the proof-of-payment image.
3. **Approve** — optionally adjust how many days are granted — or **Decline** with a note.
4. The member sees the decision and the plan is live immediately.

The live security monitor

Security runs **45 probes** — 25 core platform and 20 blockchain — every 30 seconds. Each shows Healthy / Warning / Critical / Error, which framework implements it, the implementing file, and its latency. Use **?fresh=1 sync** to force a check, and the summary tiles at the top for an at-a-glance verdict.

30. Glossary

Term	Meaning in plain English
Anchor	Writing a proof into the tamper-evident log
Assessment	The four-step health questionnaire and its AI output
Blockchain	The append-only log of proofs. Here, it runs inside SuppliWise — there is no external network
CID	A content address (<code>bafy...</code>) derived from a file's bytes, so tampering changes the ID
DAO	Decentralised Autonomous Organisation — members vote on platform parameters here
Dead hours	Midnight to 4:00 AM local, when a new plan day has not started yet
DID	Your decentralised identifier, <code>did:suppliwise:...</code>
Escrow	Funds held by the platform until delivery is confirmed
Juror	An independent staked holder who votes on a dispute
Oracle feed	A published reference value, e.g. a supplement price
Plan day	The 4 AM-to-4 AM day your tracker scores
Priority review	A flag on a severe assessment that pauses new submissions while it is reviewed
Proof-of-work	The method used to order and seal the log so it cannot be rewritten
SHA-256 digest	A one-way fingerprint. It proves something has not changed without revealing what it is
Soulbound	Earned once, never transferable or re-minted
Stake	WELL set aside, which earns APY and increases voting weight
WELL	The in-app points token. Not purchasable with money, not cashable

31. Feature → plan reference

Feature	Free	Deluxe	Premium	Ultimate
Health Assessment	✓	✓	✓	✓
Supplement Recommendations	✓	✓	✓	✓
Daily Intake tracking	✓	✓	✓	✓
Insights & Analytics	🔒	✓	✓	✓
PDF Report Export	🔒	✓	✓	✓
Web3 wallet, supply chain & proofs	🔒	✓	✓	✓
Marketplace	🔒	✓	✓	✓
DAO Governance	🔒	✓	✓	✓
Priority Assessment	🔒	🔒	✓	✓
5-Year Record History	🔒	🔒	✓	✓
AI Chat Assistant	🔒	🔒	🔒	✓
History records per page	5	10	20	20

🔒 = requires an upgrade. 🔒 🔒 = requires a higher tier. Every gate is enforced on the server, not only hidden in the interface.

****SuppliWise**** — *Stop guessing. Start knowing.* Wellness guidance, not a diagnosis. Always consult a qualified healthcare professional before starting, stopping or changing any supplement or medication.
